Intelligent hygiene station

Stay healthy with PeCo SmartProtect

PeCo SmartProtect Intelligent hygiene station

ABOUT SmartProtect

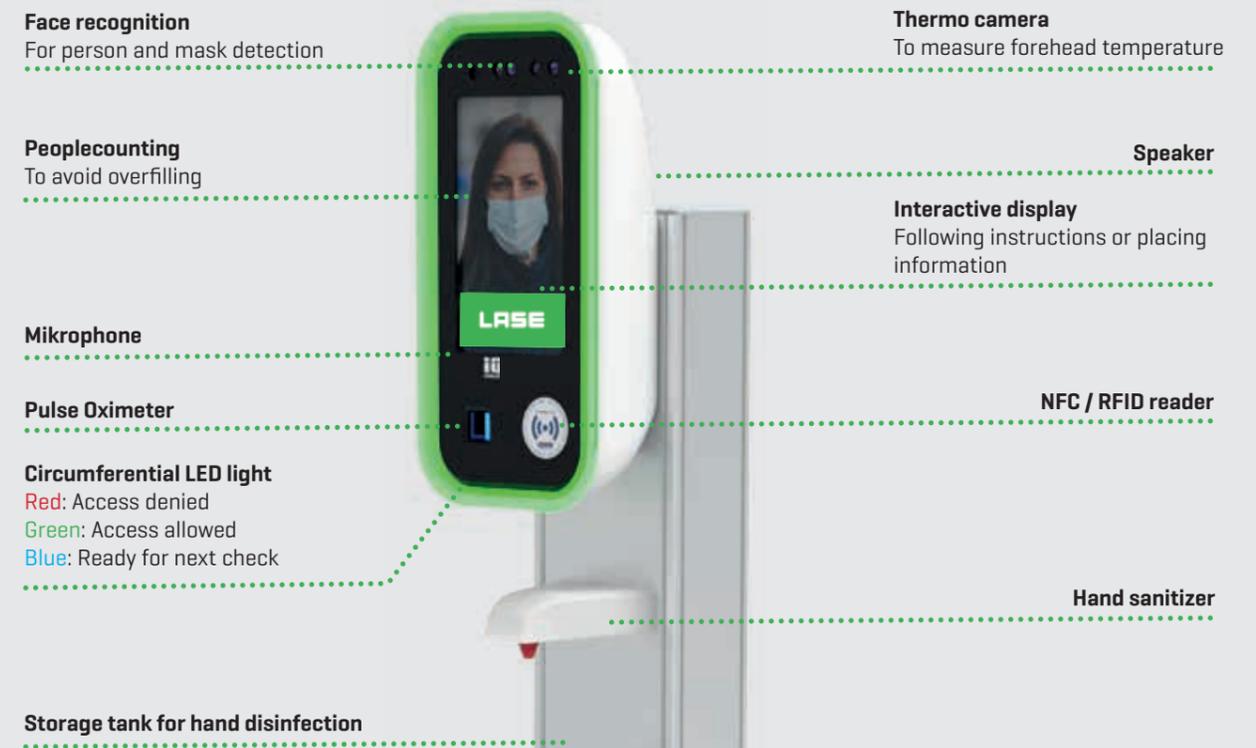

Whether retail, clinics, retirement homes, hotels, restaurants, amusement parks and much more ... Almost all sectors are currently being asked to submit corresponding concepts in which they clearly show and verifiably log their hygiene and pandemic measures. Appropriate concepts for future-proof hygiene prevention and access control are intended to prevent, for example, unauthorized close contact, disregard or forgetting of disinfection measures, too many people in one room at the same time, non-compliance with the obligation to wear masks, etc.. Many companies provide these necessary measures with their existing staff before large, partly unsolvable tasks. Above all, however, it is important to remember that the customer / visitor will have to give up their previously carefree habits in the usual form. Especially in these times, a solution is required that offers security and traceability for companies on the one hand, but also allows freedom and structured processes for customers / visitors on the other. PeCo SmartProtect as a hygiene station from the MODI HEALTH product family is a freely configurable "ALL IN ONE" access control, which fits perfectly into current and future hygiene regulations and leads to a reduction in health risks. Numerous option modules make the hygiene station your individual "gatekeeper"! With PeCo SmartProtect shopping and visits can be made as stress-free as possible and the company's health and hygiene concept, including the documentation required by the authorities, can be demonstrably secured.

Which questions does PeCo SmartProtect answer?

Communication with the customer / visitor via the hygiene column display and, if necessary, denial of access

- + Prevention of exceeding a maximum number of people within an area. When people counting is activated, a defined threshold value is checked before each access.
- + Is there a face / forehead temperature that exceeds an adjustable value? In the case of confirmation, access can be denied.
- + Do you have the contact details of the customer / visitor? The contact details can be transmitted in advance via smartphone, home PC, tablet or similar. If the customer / visitor has sent a selfie, the hygiene station automatically recognizes him / her by face recognition and the contact details are assigned. Documentation of contact details with the date and time of access and the test results in the cloud.
- + Is the person wearing a mask? If masks are mandatory, the correct wearing of the mouth and nose cover will be checked.
- + Did the customer / visitor disinfect their hands before entering? For this purpose, a sensor-controlled disinfectant dispenser is integrated into the hygiene station, which monitors use. An integrated container with a capacity of 2 liters minimizes the refilling effort and the built-in level sensor gives an alarm in good time before the container is completely empty.
- + May the visitor / customer enter the premises or should access be denied? Combination of the hygiene station with a door opener, turnstile, gate, etc. Contact can be passed on via an integrated relay or a Wiegand interface. Checking via RFID / NFC reader and chip card or face recognition is also possible.
